Although it is well known that children with thalassemia major (TM) are at risk of developing mental and physical disabilities, it is possible that they may also suffer from certain cranial birth defects. In this study, we evaluated the presence of cranial birth defects in a group of 46 thalassemic children who had regular medical examinations as outpatients. Cranial ultrasound was performed with a high-resolution real-time scanner (CDRAD III, ALOKA, Japan), and CBCT was used for additional evaluation in 16 children. A soft tissue window (80/15) was used to evaluate the bone status of the skull and sinuses. The cranial bone was evaluated using the en-face mode and the lateral and 3D reconstruction modes of the coronal and axial views. In the physical examination, there were no noticeable signs or symptoms of cranial birth defects. In the cranial ultrasound examination, although microcephaly was frequently observed, cerebellar hypoplasia and optic nerve hypoplasia were not observed in any of the children. There were no obvious facial,
